Product Description

304 Stainless Steel Color Plate AISI Customized Surface Various Color 1500 * 6000mm Size 2mm Thickness

The 300 series alloys, also known as austenitic stainless steel, are the ideal types of stainless steel for sheet metal fabrication due to their excellent formability, ductility, and weldability. These alloys have high levels of chromium and nickel which serve to increase their corrosion resistance far above that of standard steel. They are also easy to clean, making them well suited for food processing applications.

Stainless steel is widely used as a material for sheet metal parts. It has excellent corrosion resistance, good mechanical properties, and top-notch formability. These properties make it ideal for applications where sheet metal components are exposed to corrosive and extreme environments like those found in the marine, aerospace, and chemical processing industries.
